Keeping Your Whole Family Healthy
Includes Vaccinations

It’s a Family Affair
Vaccinations aren’t just for kids. People of all ages need certain vaccinations to help prevent illness and the spread of contagious diseases. Whether your household includes a newborn or grandparents, there are CDC-recommended vaccines for most everyone.

You Do It for Family
Making sure the members of your household are appropriately vaccinated is a sensible move. Every generation could be at risk for a vaccine preventable disease, so talk to your family physician to learn more about the CDC-recommended vaccinations by age. Vaccines are especially important for at-risk populations, including young children and older adults, or people with chronic health conditions.

From infancy to adolescence, vaccines help protect children against potentially serious diseases. To find out more about what vaccines are recommended for your child, visit the CDC website or talk to your child’s pediatrician or family physician.

That’s not all …
As we age, certain vaccines are needed to help protect your loved ones through adulthood. Visit the CDC website to learn more about what CDC-recommended vaccines are recommended during adulthood or talk to your doctor to learn more.

Not every household is the same. Talk with your doctor about your family’s needs, at-risk populations, and other concerns you may have to help keep your family safe from illness and contagious diseases.
